

Case Study— Pipework Installation

We were asked by one of our customers to move two hydraulic systems. This involved cutting into existing pipe work and installing circa 100 metres of new pipe work. As you can see from the pictures below the finished product was neat, functional and properly clamped at industry recommended intervals.

The new pipe work and clamps were initially assembled on site and removed for flushing and testing. The onsite work took two days, during a shut down, when we connected to the existing imperial pipe system, and connected the power packs via hoses.

The customer incurred minimal down time, minimal disruption and gained a new leak free and safe pipe work system.
